

SYSTECH INTERNATIONAL PACKAGING EXECUTION SYSTEM

Packaging execution system provider Systech International has introduced version 8.0 of its Systech TIPS Engine, which uses a building-block architecture to represent the workflow of a packaging line. Tailored for pharmaceutical manufacturers, the software mirrors actual packaging line information functions, including vision inspection, line management, serialization, and performance measurement. Data from each vision and line management system streams quickly to other critical packaging line applications, such as serialized product tracking and overall equipment effectiveness (OEE). A new engine user interface uses icons, which packaging line engineers can assemble and realign as needed, to visually represent the system's components and functions. The system also can be integrated with enterprise or manufacturing systems.
